Birds

Bird mitigation measures during operation of the Grosse-Île Wind Farm

- Bird mortality monitoring (year 1, 2, 3 and every 10 years thereafter).
- Installation of an atmospheric visibility detector at locations 6 and 7, activated when visibility falls below 200 m during the Horned Grebe nesting period
- Examples of measures to be implemented if dune excavation or borrow pit operations are carried out during the Bank Swallow nesting period (ECCC):
 - Burrows surveys
 - Selection of borrow pits free of active burrows
 - Slope grading
 - 50m protective zone around observed colonies

Thank you!
